Immediate Feedback on Project Direction

Company name:

Easy as Pi.

Technical aspects:

All well thought out but you are missing a major component: code.

HTML is a markup language and doesn't 'count' as code as far as the course is concerned. You have various things you could do:

- Django (this is how I would recommend building the website if it was to be a 'real' product);

- javascript (a language that browsers can interpret);

- Include embedded Sage cells to help illustrate things (easiest thing to do as you can just embed them in your plain HTML).

Initial comments about write up:

No context given to the process diagram and the pseudo code was a bit nonsensical.

Initial comments about strategy:

I like your usp.

General comments

Concentrate on technical aspects as well as specifying your strategy.
